

## ABSTRACT

A graft copolymer composition obtained by mixing a graft copolymer (A) containing a rubbery polymer having a glass transition temperature of not higher than 0°C as a trunk polymer and containing a alkyl ester of methacrylic acid-base polymer as a graft component, and having a mean particle size of at least 0.15  $\mu\text{m}$ , and a graft copolymer (B) having a means particle size of from 0.03 to 0.13  $\mu\text{m}$ ; and a vinyl chloride-base resin composition containing the above-described graft copolymer composition as an impact modifier.

The vinyl chloride-base resin composition is excellent in the impact strength and can be suitably used for the productions of pipes, window frames, joints, fences, doors, switch boxes, etc.
